## **Hands-on Lab - React Application (1 hour 15 mins)**

#### Objective for Exercise:

By the end of this lab, create HTML Pages with React Components and React applications.

#### Prerequisite

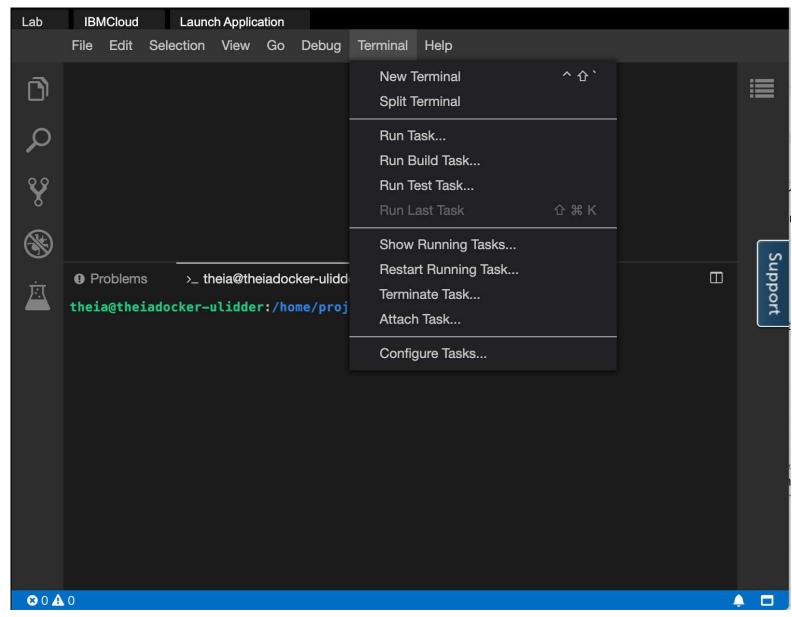

Before you start, be sure that you meet these prerequisites:

- · Basic knowledge of JavaScript
- Basic knowledge of HTML

## **Set-up**: Check for the cloned files

1. Open a terminal window by using the menu in the editor: Terminal > New Terminal.

about:blank 1/23

2. Change to your project folder.

1. 1

cd /home/project

Copied!

3. Check if you have the folder lkpho-Cloud-applications-with-Node.js-and-React

1. 1

about:blank 2/23

ls /home/project

Copied!

If you do, you can skip to step 5.

4. Clone the git repository that contains the artifacts needed for this lab, if it doesn't already exist.

1.

1. git clone https://github.com/ibm-developer-skills-network/lkpho-Cloud-applications-with-Node.js-and-React.git

Copied!

5. Change to the directory for this lab.

1. 1

cd lkpho-Cloud-applications-with-Node.js-and-React/CD220Labs/

Copied!

6. List the contents of react\_pages. This should contain HTML page(s) which you can download and view in your local system.

1. 1

ls react\_pages

Copied!

7. List the contents of todoapp. This should contain a directory structure with a pre-installed react app.

1. 1

ls todoapp

Copied!

8. List the contents of react-apps. This should contain a directory structure with a pre-installed react app that you can change to apply what you have learned.

1. 1

1. ls react-apps

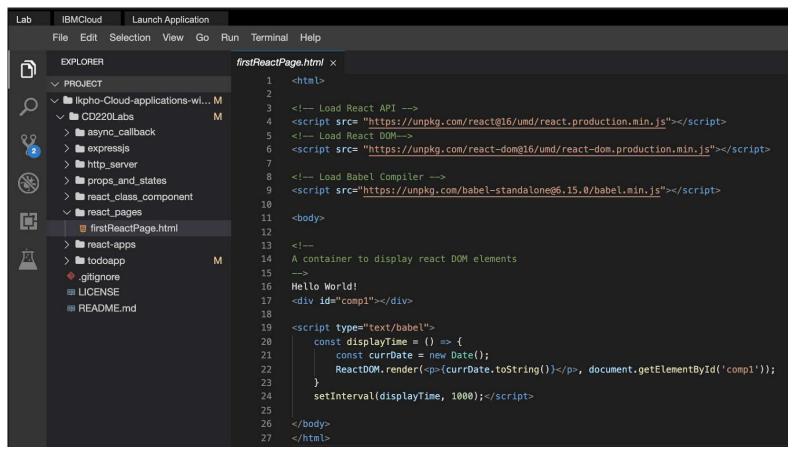

Copied!

These are the two directories you will be using for this lab.

## **Exercise 1: Simple HTML with React**

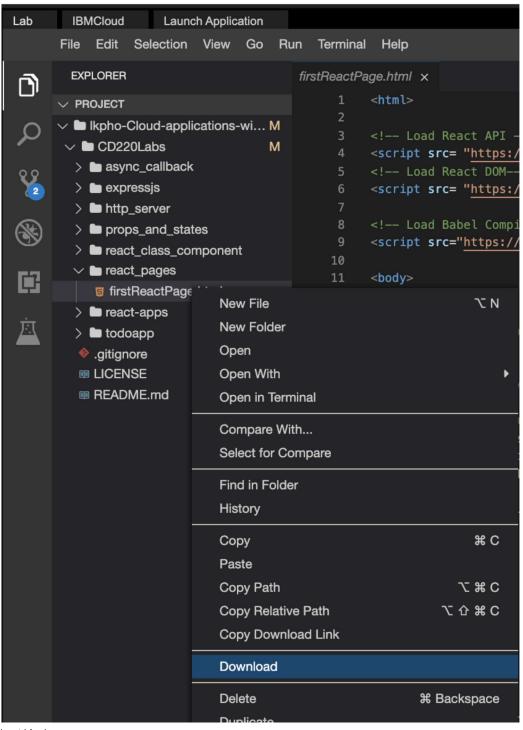

1. In the file explorer goto lkpho-Cloud-applications-with-Node.js-and-React->CD220Labs->react\_pages and view firstReactPage.html. The contents will appear as below. It is a HTML page where the clock is displayed through a react component.

about:blank 3/23

2. Right-click on firstReactPage.html and click on Download. This will download a copy of this file in your local system.

about:blank 4/23

about:blank 5/23

3. Now open the downloaded file in your local browser. The page will appear as below.

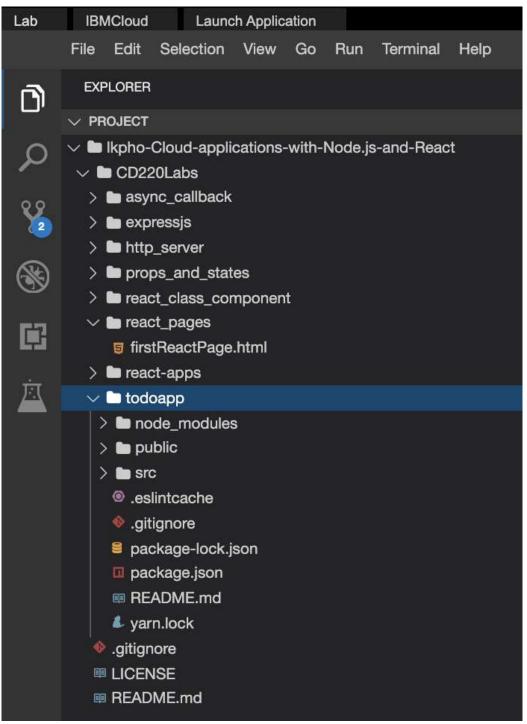

Hello World!

Fri Nov 27 2020 15:17:36 GMT+0530 (India Standard Time)

## **Exercise 2: First React Application**

The todoapp is a react app that has been created for you using npx create-react-app todoapp command. In the files explorer view todoapp directory. It would appear like this.

about:blank 6/23

about:blank 7/23

2. In the terminal window run the following commands one after the other.

1. 1

2. 2 3. 3

cd todoapp

2. npm install

3. npm start

Copied!

The first command changes to the todoapp directory. Second command installs the files required for the React app in your lab environment and the third one starts the server.

You will see this output indicating that the server is running.

```
Problems theia@theiadocker.avan, a.e. /home/project/lkpho-Cloud-applications-with-Node.js-and-React/CD220Labs/todoapp × Compiled successfully!

You can now view todoapp in the browser.

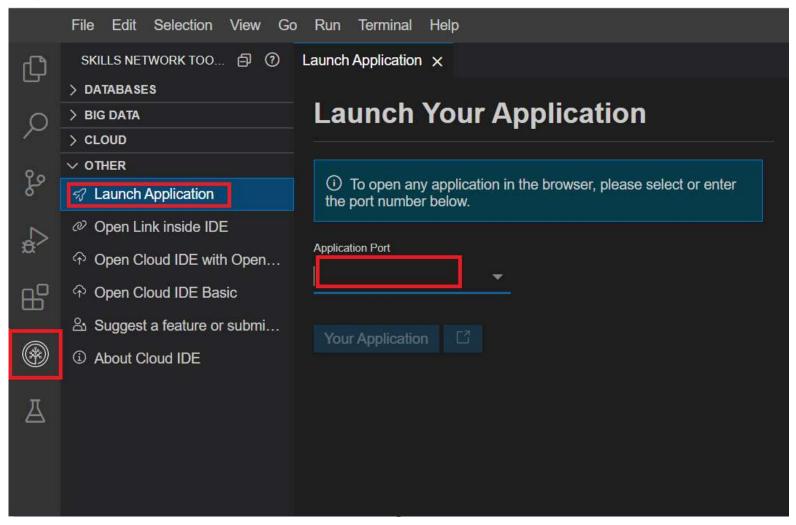

Local: http://localhost:3000
On Your Network: http://172.30.91.198:3000

Note that the development build is not optimized. To create a production build, use yarn build.
```

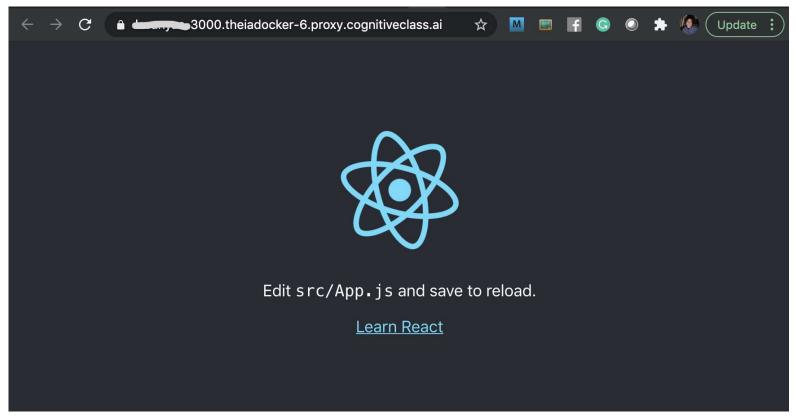

3. Click on the button below to open the React application on new browswer tab or click Skills Network button on the left, choose the Other option and then click Launch Application and connect to port 3000.

REACT Application

about:blank 8/23

The todoapp UI will appear on the browser as seen in the image below.

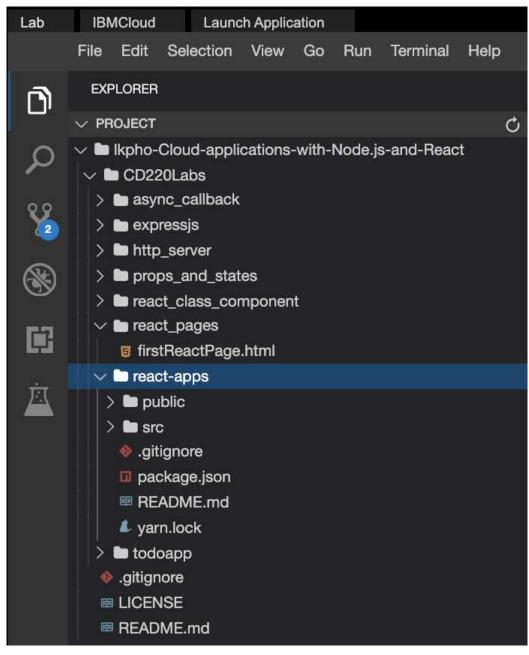

4. To stop the server, go to the main command window and press Ctrl+c to stop the server.

### **Exercise 3: Function Components, Class Components, Properties and States**

The react-apps is a react app that has been created for you using npx create-react-app react-apps command. In the files explorer view react-apps directory. It would appear like this.

about:blank 10/23

2. In the terminal window run the following commands one after the other.

1. 1

2. 2

3. 3

 ${\bf 1.} \ {\it cd /home/project/lkpho-Cloud-applications-with-Node.js-and-React/CD220Labs/react-apps}$ 

about:blank 11/23

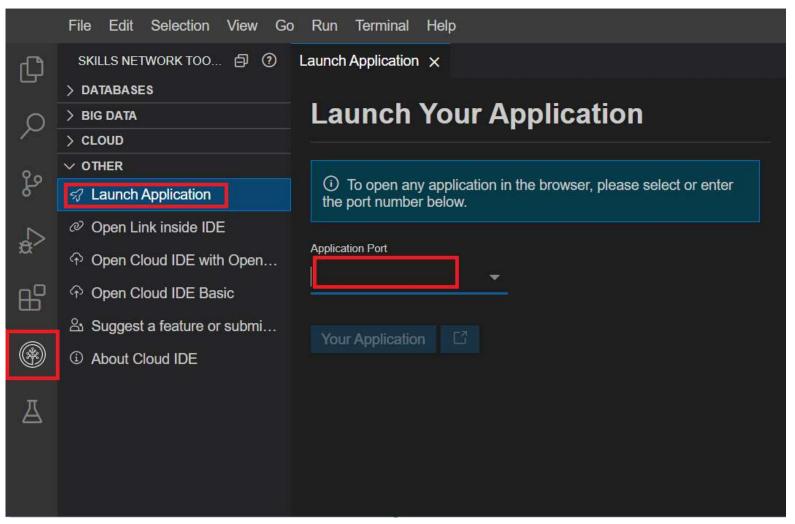

- npm install
- 3. npm start

The first command changes to the react-apps directory. Second command installs the files required for the React app in your lab environment and the third one starts the server.

You will see this output indicating that the server is running.

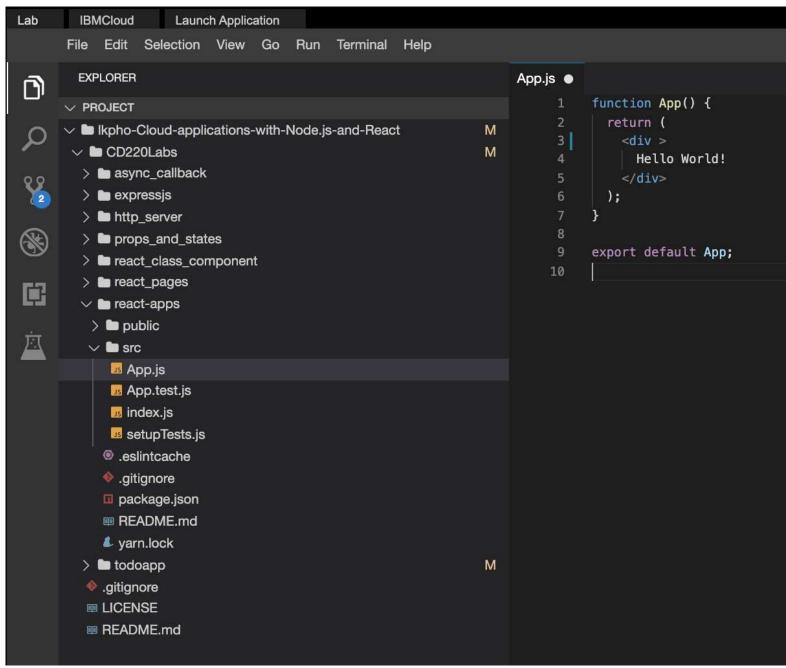

3. To see what UI this React app renders, click on the Skills Network button on the left, it will open the "Skills Network Toolbox". Then click the Other then Launch Application. From there enter the port number the server is running on, which is 3000 and then launch.

The react-apps UI will appear on the browser. All the styling has been removed and you should see Hello World written on the page.

4. View the content on App.js under react-apps->src in the file explorer. It will appear as below.

about:blank 12/23

5. Now let's start adding a component to the page. When the server is running, any change made to the files is automatically picked up by the server.

The code in App.js will show as given below.

1. 1

about:blank 13/23

```
2. 2
3. 3
4. 4
5.5
6.6
7. 7
8.8
9.9
1. function App() {
2. return (
      <div >
4.
        Hello World!
5.
      </div>
6. );
7. }
export default App;
Copied!
```

It is a function component. Let's make changes to the code to accept the color as props.

6. Replace the content of App.js with the following code.

```
1. 1
2. 2
3. 3
4.4
5.5
6.6
7. 7
8.8
9.9
10. 10
11. 11
12. 12
13. 13
14. 14
15. 15
1. function App(props) {
const colorStyle = {
       color:props.color,
3.
4.
       fontSize:props.size+"px"
5. }
6.
     return (
7.
      <div>
8.
         <div style={colorStyle}>
9.
         Hello World!
         </div>
10.
      </div>
11.
12. );
13. }
14.
15. export default App;
```

Copied!

We have made changes to App.js to make it a component which will take some style setting as props. We now have to set the properties.

7. To set the props of the App component, we will make changes in index.js. Replace the content of index.js with the code given below.

1. 1 2. 2 3. 3 4. 4 5. 5 6. 6 7. 7 8. 8 9. 9

```
    import React from 'react';
    import ReactDOM from 'react-dom';
    import App from './App';
    ReactDOM.render(
    <React.StrictMode>
    <App color="green" size="20"/>
    </React.StrictMode>,
    document.getElementById('root')
    );

Copied!
```

As can be seen in the code we are passing the color and size.

8. Now when you refresh the broswer rendering, it will be rerendered with the style.

#### **Practice Exercise**

· Add other styling to the components.

9. Now let's change the same to a class component instead of a function component. Replace the App.js code with the following code.

```
1. 1
 2. 2
 3.3
 4.4
 5.5
 6.6
 7. 7
 8.8
9.9
10. 10
11. 11
12. 12
13. 13
14. 14
15. 15
16. 16
17. 17
18. 18
19. 19
20. 20
21. 21
22. 22
23. 23

    import React from 'react';

2.
3. class App extends React.Component {
 4.
      constructor(props) {
 5.
       super(props);
 6.
 7.
 8.
      render() {
 9.
       const colorStyle = {
       color:this.props.color,
10.
       fontSize:this.props.size+"px"
11.
12.
       return (
13.
14.
         <div>
15.
           <div style={colorStyle}>
           Hello World!
16.
           </div>
17.
18.
         </div>
19.
       );
20.
21. }
22.
23. export default App;
```

about:blank

Copied!

10. Refresh the page that was rendered earlier to see how different it is. You will observe that nothing has changed. All that we have done is replaced the function component with class components. So the props can be passed to both function and class components.

11. Let's set the props from outside and maintain the state of the component inside. The state we will maintain is the number of times the button was clicked. Replace the code in App.js with the following code and save it. Refresh the page that is rendered.

```
2. 2
3.3
 4.4
 7. 7
 8.8
9.9
10. 10
11. 11
12. 12
13. 13
14. 14
15. 15
16. 16
17. 17
18. 18
19. 19
20. 20
21. 21
22. 22
23. 23
24. 24
25. 25
26. 26
27. 27

    import React from 'react';

 3. class App extends React.Component {
      constructor(props) {
       super(props);
 5.
 6.
 7.
      state = { counter:0 }
9.
      incrementCounter = ()=> {
10.
       this.setState({counter:this.state.counter+1});
11.
     }
12.
      render() {
13.
       const colorStyle = { color:this.props.color,fontSize:this.props.size+"px"}
14.
15.
         <div style={colorStyle}>
16.
17.
            React Component
            <br /><br />
18.
19.
            <button onClick={this.incrementCounter}>Click Me!</button>
20.
            <br /><br />
21.
            {this.state.counter}
22.
          </div>
23.
       );
24.
25. }
27. export default App;
```

Copied!

You will see that the counter state is being refreshed everytime the button is clicked.

12. To stop the server, go to the main command window and press Ctrl+c to stop the server.

# Exercise 4: Class Components - componentDidMount

1. Let's make changes in App.js to send a API request to a remote server when the component mounts, and change the state when the remote server responds.

about:blank 16/23 Replace the code in App.js that we used in the previous exercise.

```
2. 2
3. 3
4. 4
5.5
6.6
7. 7
8.8
9.9
10. 10
11. 11
12. 12
13. 13
14. 14
15. 15
16. 16
17. 17
18. 18
19. 19
20. 20
21. 21
22. 22
23. 23
24. 24
25. 25
26. 26
27. 27
28. 28
29. 29
30. 30
31. 31
32. 32
33. 33
34. 34
35. 35
36. 36
37. 37
38. 38
39. 39
40. 40
41. 41
42. 42
43. 43
44. 44

    import React from 'react';

import axios from 'axios';
4. class App extends React.Component {
5. state = { APIlist:[] }
6.
7.
     componentDidMount() {
       let url = "https://api.publicapis.org/entries?category=Animals";
8.
9.
       axios({
         method: 'get',
10.
11.
         url: url,
12.
         responseType: 'json'
       }).then(resp => {
13.
           let listOfEntries = resp.data.entries;
14.
15.
           let listOfEntriesAsArray = Object.entries(listOfEntries);
16.
           let entryDetails = listOfEntriesAsArray.map((entryDetail)=>{
17.
            return {entryDetail[1]["API"]}
            ----- {entryDetail[1]["Link"]} 
18.
19.
20.
           this.setState({APIlist:{entryDetails}})
21.
22.
       .catch(err => {
23.
           console.log(err.toString())
24.
      });
25. }
```

about:blank 17/23

```
27.
     render() {
28.
       const colorStyle = { color:this.props.color,fontSize:this.props.size+"px"}
29.
30.
         <div style={colorStyle}>
31.
           <h2>APIs List</h2>
32.
           <br/>
33.
34.
            <div>
35.
               this.state.APIlist
36.
37.
38.
            </div>
39.
       </div>
40.
       );
41. }
42. }
43.
44. export default App;
```

Copied!

As you can see initially the state of the component APIList is an empty list. When the component mounts, the request is sent through axios asynchronously and then depending on the list returned, the setState is invoked.

2. This code requires the axios module to run. Run the following command to install it.

npm install --save axios

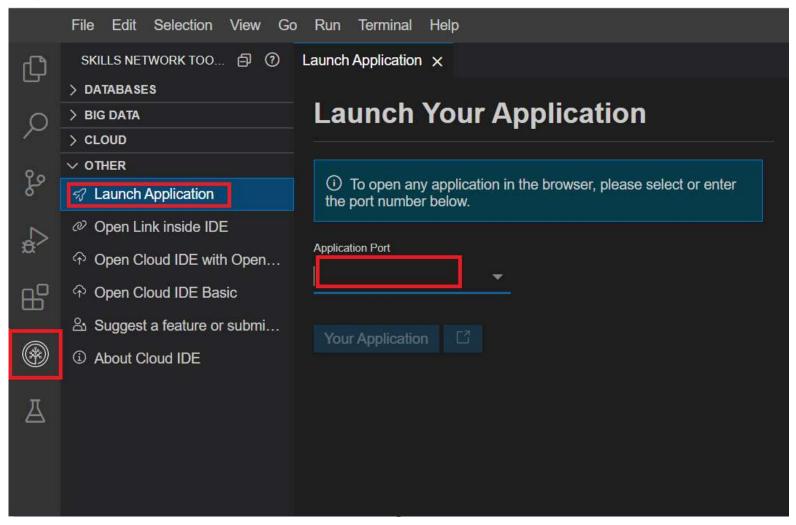

3. Ensure that you are in the react-apps directory. Run the following command to see which directory you are currently in.

pwd

- 4. If you are not in /home/project/lkpho-Cloud-applications-with-Node.js-and-React/CD220Labs/react-apps, run the following command to change to that directory. Else skip to step 5.
- cd /home/project/lkpho-Cloud-applications-with-Node.js-and-React/CD220Labs/react-apps
  - 5. Run npm start in the terminal to start the react app.
  - 6. Click on the button below to open the React application on new browswer tab or click Skills Network button on the left, choose the Other option and then click Launch Application and connect to port 3000.

REACT Application

about:blank 18/23

The output would look like this.

about:blank 19/23
